Description

Fineline veneers, also called designer veneers or multilaminar wood, are produced using a special process. For this purpose, sliced or peeled veneers of different types of wood

or dyed veneers in different shapes and structures are glued into veneer blocks in order to produce new veneers from them again. In addition to the reproduction of wood species,

fantasy structures can also be produced. Fineline veneers are uniform in colour and the design is consistent. This makes design veneers ideal for large projects that require a uniform structure, colour and look.

Specifications

| | |
